discom

EXHAUST TECHNOLOGY

Discom is known as a specialist on exhaust noise reduction. Yet this is not our only expertise. You can also count on us when it comes to emission limitation questions.

For the use for generators we have developed a plug and play solution for new and existing engines.

The Discom Modular Emission Skid (DMES).

This solution has proven itself in practice and Will fit seamlessly over each type of generator canopy or on a container. We adapt the system to the dimensions of the canopy or add cornerblocks so it can connect to your container.

The main advantage of this concept is that it will be employable for all your sets with the same engine specifications!

This allows you to alternate the system within your fleet and are able to adjust the demand of your client.

When your client is in need of a Stage V set (or Any other emission demand), you can simply place the frame over your canopy or on top of your container. We will take care of the proper working and within short notice you can deliver a silent and clean set to your client!

These configurations are equipped with the latest techniques of emission technology. By doing so you do not need pressurized air to inject the urea in the system. The software is user friendly and easy to read. Even remotely!

Obviously, as it is in our nature, the attenuation is excellent and that attenuation is variable to suit your demands.

The configuration is completely suitable to be customized to your wishes; additional attenuation, integrated spark arrestor, special coating and more.
